Center for Survey Statistics & Methodology

IOWA STATE UNIVERSITY
OF SCIENCE AND TECHNOLOGY
AMES, IOWA

Introduction

In an effort to achieve greater consistency and comparability in state-wide seat belt use reporting, the National Highway Traffic Safety Administration (NHTSA) issued new requirements in 2011 for observing and reporting future seat belt use. The requirements included the involvement of a qualified statistician in the sampling and weighting portions of the process as well as a variety of operational details.

The Iowa Governor's Traffic Safety Bureau contracted with Iowa State University's Center for Survey Statistics and Methodology (CSSM) (then Survey & Behavioral Research Services) in 2011 to develop the study design and data collection plan for the State of Iowa's annual survey that would meet the new requirements of the NHTSA. A seat belt survey plan for Iowa was developed by CSSM with statistical expertise provided by Zhengyuan Zhu, Ph.D., Professor of Statistics at Iowa State University and Director of the Center for Survey Statistics and Methodology. The plan was approved by NHTSA on March 19, 2012 and implemented for five years, in the summers of 2012-2016.

As required by NHTSA, the Iowa plan was revised in the fall of 2016. Dr. Emily Berg, Assistant Professor of Statistics at Iowa State University, followed the protocol of the original approved plan and redrew the counties and road segments to be used for future data collection. After examining current county data relating to fatalities, vehicle miles traveled, and other relevant factors, she sampled 15 counties (as in 2012) but increased the number of sampled road segments from 75 to 84. Six of the 15 counties used in 2012-2016 were also selected for the new plan; nine counties were different. As in Iowa's 2012 plan, five road segments were sampled from each county; however, the new plan increased the number of sampled road segments from Polk County to 14 because of its significantly higher traffic levels. The revised plan was submitted in December of 2016 and approved in March of 2017. This plan was implemented by CSSM in 2017, 2018, 2019, and again in 2020.

2020 Data Collection

The Iowa GTSB has contracted with CSSM on an annual basis to conduct the seat belt use data collection since 2012. The primary contact at the Iowa GTSB in 2020 is Cinnamon Weigel, Occupant Protection Coordinator. The primary contact at CSSM is Mallary Allen, PhD, Survey Unit Director. The CSSM Seat Belt Survey Project Manager is Jody Fox. The CSSM statistician for the 2019 Seat Belt Survey is Emily Berg, PhD, Assistant Professor of Statistics at Iowa State University. This report describes the data collection process for obtaining 2020 seat belt use data as stipulated by the approved study design. It also includes tables with overall results showing seat belt use in Iowa.

Preparation

Preparation for the 2020 seat belt use data collection involved several components, including: verification of the usability of the sampled sites, revision of materials for Data Collectors, and notification of appropriate local personnel prior to data collection.

Site Verification.

The Iowa Seat Belt Survey Plan includes 84 road segments or sites sampled for annual observation, with 5 sites in each of 14 sampled counties and 14 sites in Polk County. The sites are identified by MSLINK numbers. CSSM has worked with staff from *InTrans*, the Iowa State University Institute of Transportation, to obtain data and photographic resources that allow staff to examine each site remotely for accessibility, safety, and practicality. The CSSM Project Manager re-examined the 84 sites for any changes since 2019 and checked with the Department of Transportation and other online sources for scheduled construction that could impact traffic patterns. Two sites in Allamakee County were under construction during our data collection time frame and were replaced by sampled alternates. Otherwise no other issues were found and the remaining 82 sites were verified as safe and useable for 2020.

Materials Preparation.

After the 84 sites were finalized, CSSM staff used online maps and Google Earth as well as notes from 2017, 2018, and 2019 observers to identify and recommend observation points that would be safe and still provide the visibility necessary to observe seat belt use. CSSM staff updated existing maps for Data Collectors to use as references when traveling to sites. Department of Transportation maps, Google maps, and city maps all served as effective resources.

Equipment was prepared for use by Data Collectors, including vests, hats, warning lights, signs, stop watches, and clickers. Data collection forms were printed. Data Collection schedules were prepared for each Data Collector and administrative procedures were documented.

Notification.

Prior to the data collection process, the GTSB representative notified law enforcement personnel in each of the site areas. CSSM staff notified other appropriate city/county and Department of Transportation personnel. The purpose was to ensure that the appropriate officials in each site area would be aware of the project and the days and times that Data Collectors would be at work in their area.

Data Collection Staff Training

Iowa utilized five primary data collectors in 2020, responsible for 10 to 20 sites each. All data collectors were experienced, having worked as data collectors for the project in the past. Quality Control functions were filled by three individuals: the Project Manager, one experienced data collector, and one staff member new to the project.

Training for 2020 was held at CSSM on one day, June 8, 2020, with field data collection beginning on June 9, 2020. The training occurred in a large room with physical distancing at all times. Trainers and Data Collectors were required to wear masks/face coverings at all times. The training included a combination of lecture,

classroom and field exercises. Training sessions covered data collection protocols, including how to find the observation sites, choosing an observation location, how to properly collect data, practice in what counts as seat belt “use,” “nonuse,” and “use unknown,” what to do if data cannot be collected at a site due to road construction, weather, or other circumstances, and the appropriate management and submission of collected data. Roadside safety training was provided by the Project Manager, using information from David Veneziano, Safety Circuit Rider at Iowa State University’s Institute for Transportation (*InTrans*). The 2020 training agenda is shown in Figure 1.

Another safety feature added for 2020 was the provision of a laminated statement printed on CSSM letterhead that data collectors could present to law enforcement and community members if approached with inquiries about their presence at assigned sites. Data collection started just after some major protests and riots in the area, so training included suggestions and expectations regarding potential encounters with police and protestors. Data collectors were advised to carry the laminated statement on their clipboards along with several paper copies for distribution if needed. (Appendix C)

The new quality control monitor received some additional one-on-one training with the Project Manager to ensure that they were comfortable with project procedures and observation site identification.

The QC Monitors reviewed the specific duties of the position. Quality Control duties included conducting unannounced site visits to a minimum of two sites for each Data Collector (12% of the total sites) and reviewing the Data Collector’s field protocol. The QC Monitors met with the Data Collectors in the field to answer questions and offer assistance as needed.

Data Collectors were provided with bright yellow vests and hats to wear for safety and protection from sun and light rain. Each Data Collector had a flashing amber light to put on his/her car and a clicker-counter and stop watch to use as needed. Each Data Collector was also provided with two “Survey Crew Ahead” signs and sandbag weights for use in high speed areas and other sites as appropriate.

In 2020 the data collectors were also supplied with hand sanitizer, one face mask each, disposable gloves (10 pairs), and extra Ziploc baggies to dispose of any trash, gloves, etc., in a safe way. Training included group discussion of safety measures and comfort level regarding avoiding exposure to COVID-19 when getting food from restaurants, pumping gas, and using public restrooms. The Data Collectors guided the discussion with some input from the Project Manager.

Figure 1.

Seat Belt Data Collectors 2020 Training Agenda	
<u>Monday, June 8, 2020</u>	
Seat Belt Survey Overview	Study Design
	NHTSA Requirements
	Data Collection Requirements
	Definitions of terms
Safety Training (Jody Fox, Project Manager)	Signage and visibility
	Roadway safety
Data Collection Procedures	Assignments & Rescheduling
Site Locations	Low/High volume roadways
	Locating assigned sites
	Site assignment sheets & maps
Data Collection	Data Collection & Observation forms
	Recording alternate site information
	Traffic Counts
	Recording observations
Quality Control and QC monitoring	
Field Practice	Setting up road work signs
	Highway observations
	Practice counts
Special Considerations for 2020	Pandemic Training/Expectations
	Appropriate response to community or Law Enforcement questions regarding protests/riots
	Essential Worker statement/hand-out
Timesheets and expense reports	
Debriefing	

Observation Protocols and Procedures

All passenger vehicles, including commercial vehicles weighing less than 10,000 pounds, were eligible for observation. Data Collectors completed two forms in the field, the Observation Site Form and the Observation Tally Form, which are shown in Appendixes A and B. The Observation Site Form documented descriptive information about each site. Data Collectors recorded information including observation date, site location and number, alternative site data, traffic directions and lanes available and observed, start and end times for observations, and weather conditions.

The Observation Tally Form was used to mark belt use/non-use/unknown use for drivers and right front passengers. Using the Observation Tally Form, seat belt use observations were made of all passenger vehicle drivers and right front seat occupants in the selected lane. The only passenger vehicle right front seat occupants excluded from the study were child passengers traveling in child seats with harness straps. If there was no passenger in the right front seat of an observed vehicle, that information was also noted on the Observation Tally Form.

Seat Belt use categories - Data Collectors recorded belt use for the driver and right front seat passenger using the definitions shown in Figure 2 below, which were provided in the federal regulations.

Figure 2.

Code	Meaning	Definition
Y	Yes, belted	The shoulder belt is in front of the person's shoulder.
N	No, unbelted	The shoulder belt is not in front of the person's shoulder.
U	Unknown	It cannot reasonably be determined whether the driver or right front passenger is belted.
NP	No passenger	There is no right front passenger present.

Scheduling.

Data collectors were generally assigned one county with five observation sites per work day. The 14 Polk County sites were divided among three Data Collectors. A schedule of sites with observation start times was provided by CSSM in order to ensure a representative sampling of times of day for the data collection and to allow for proper notification of county/city and law enforcement personnel. Observations were to start at the assigned times, as much as possible, and to continue for exactly one hour. Previous years' counts were 45 minutes per site but the team decided this year to count for 60 minutes per site due to the possibility of fewer vehicles being on the roads due to the pandemic.

Observations.

Data Collectors observed one lane and one direction of travel per observation site. The direction of travel was randomly assigned by the office; however, Data Collectors were allowed to observe the other direction if safety or windshield glare dictated. Deviations from the randomly assigned direction were noted on the

Observation Site Form. If an assigned road segment included an intersection, Data Collectors were instructed to observe traffic traveling on the assigned road segment, not the cross-street.

Lower volume roadways such as county roads and streets were observed from a field drive or other location where data collectors could safely move their vehicles from the roadway. In some cases Data Collectors observed from their vehicle while, in most cases, observing from outside of the vehicle was more effective. At times Data Collectors found that sitting in the back of their pick-up truck, van, or SUV provided the safest observation point with the best view.

Whenever possible, observations for high-volume, limited access roadways were made from an overpass. Observing from an overpass allowed for comparatively easy viewing of seatbelt use for both the driver and the passenger. Gravel road overpasses were preferred because of the low traffic volume, reducing safety hazards to the Data Collector. In some instances observing from an overpass required moving the observation point from the specific road segment by a few miles; however, because of the limited exit and entrance ramps to these roadways, there were no significant changes to the observed vehicles between the assigned road segment and the observation point.

If a low volume overpass was not available, Data Collectors were allowed to observe traffic at an exit ramp or rest stop. Because the exit ramp/rest stop only sampled a portion of the traffic passing on the main highway, an additional traffic volume count was required in order to adjust for the reduced numbers. Data collectors completed a traffic count of the assigned highway segment immediately following the observations at the ramp/rest stop. From a safe observation point from which to view passing cars (but not necessarily belt usage), the data collector counted passing cars in one direction and in one lane of the assigned road segment, timing the number of minutes to reach a count of 100 cars. If the traffic volume was low, the count continued for 15 minutes, at which point the data collector recorded the number of cars observed in a 15 minute time frame. This traffic count information was recorded on the Observation Site Form and was used to adjust the seat belt usage observation data when observations were made away from the selected road segment at a rest stop or exit ramp. Five rest stop sites were used in 2020.

Alternate Sites.

If unexpected construction or difficulty in locating a useable and safe place to observe required the Data collector to deviate farther than 2 miles (or more than one block in city situations) from the selected road segment, he/she was instructed to call the office before proceeding and to note the location as an alternate site on the Observation Site form. For the 2020 data collection, two new alternate sites were needed unexpectedly. In both cases, the sampled road was closed for construction.

Rescheduling.

If an assigned road segment was temporarily unavailable due to a traffic accident or inclement weather, data collection was to be rescheduled another week for the same time and day of the week. In 2020, data collection was canceled on June 10 due to rain and storms, and those sites were rescheduled as close to the same day of the week as possible.

Results

Data collection for 2020 occurred from Tuesday, June 9 through Sunday, June 21, 2020. The 2020 seat belt use data collection resulted in the observation of **15,688 passenger vehicles**, with a right front seat passenger in

5,467 of those vehicles, for a total of **21,155 potential observations** of belt use. Of these 21,155 potential observations, there were 14,925 drivers and 5,070 right front passengers who were observed to be wearing seat belts (total 19,995 seat belt users). Seat belts were not worn by 763 drivers and 397 right front passengers (total 847 unbelted). Data collectors were unable to observe the seat belt use of 240 drivers and 73 passengers (total 313 unknown use). The **unknown use, or “nonresponse rate,” is .0148 or 1.48%**. This is well within the range allowed by federal regulations, which require the nonresponse rate to be below 10%.

The number of observations in 2020 is 2,670 more than in 2019; the number of vehicles observed increased by 2,129 and the number of passengers increased by 631. The number of observations varies from year to year in part because sites are intentionally observed on different days of the week and times of day as much as is practical. As well, the 2020 observations were bumped to 60 minutes rather than 45 minutes. Federal regulations require a minimum of 7500 observations, and the 2020 total of 15,688 passenger vehicles with 21,155 observed occupants far exceeds the minimum requirement.

Ten quality control checks were completed in 2020. Each of the five primary data collectors was observed by a quality control monitor at two unannounced sites to ensure compliance with project protocols. This comprises 12% of the sites (10 out of 84), which exceeds the minimum of 5% required by federal regulations. No problems were identified through these quality control checks

Federal regulations require the calculation of seat belt use to be conducted with weighted data as described in the approved survey plan. Data weighting was completed by Dr. Emily Berg, Assistant Professor of Statistics at Iowa State University. Based on the weighted data, **Iowa’s overall seat belt use rate for 2020 is 95.2%**, with an **estimated standard error of .97% (± 1%)**. Weighted seat belt use rates since 2012 are shown in Figure 3.

Figure 3. Iowa’s Annual Weighted Seat Belt Use Rate, 2012-2020.

Year	Weighted Belt Use
2020	95.2%
2019	94.6%
2018	93.9%
2017	91.4%
2016	93.8%
2015	93.0%
2014	92.8%
2013	91.9%
2012	92.4%

Tables and Appendices

Table 1 lists the 84 observation sites with selected characteristics and the number of belted drivers and right front passengers.

Tables 2 and 3 show the seat belt use of drivers and passengers by county. Table 2 contains the number or count of each category of belt use by drivers, passengers, and total for each sampled county. Table 3 contains two types of unweighted percentages of belt use for drivers, passengers, and combined total for each county. The “% of Total Belted” is the percent of the total number of persons (both drivers and passengers) who were belted. The “% of Known Belted” removes the persons with unknown belt use from the base number, so it becomes the percent of persons with known seat belt status who were belted. Note that these percentages are unweighted and the state-wide seat belt use percentage is slightly different than the weighted seat belt use percentage required by federal regulations for reporting. Nevertheless the unweighted percentages in Table 3 enable legitimate comparisons between seat belt users/nonusers and between counties.

Tables 4 and 5 show the seat belt use of drivers and passengers by road type. Table 4 contains the number in each category and Table 5 contains unweighted percentages. Federal regulations required the new survey plan to classify road types as primary (including interstates), secondary, and local.

Table 6 contains seat belt use of drivers and passengers by day of the week and road type. The percentages included in the table are unweighted.

Table 7 contains seat belt use of drivers and passengers by time of day and road type. The percentages included in the table are unweighted.

Table 8 contains sample weights for each observation site as well as seat belt use for drivers and passengers (number or count). This information is used for Part B reporting purposes.

Appendix A. Observation Site Form 2020

Iowa Seat Belt Survey
Observation Site Form

Data Collector ID# _____

Date: ____ / ____ / 2015

Site Identification:

ID: _____	County : _____
Road Name: _____	Co Site #: _____

Site Start and End Time:

Start time for observations: _____ am/pm
End time for observations: _____ am/pm
(Total observation period MUST last exactly 45 minutes)

Site Description:

Selected traffic flow direction: North South East West
Total number of lanes in selected direction: _____
Weather Conditions: Clear Cloudy/PC Light Fog Light Rain

Alternate Site Information:

Is this an alternate site (not including a recommended observation point)?	No	Yes
If yes, why was an alternate site needed?		

Traffic Count:

Is a traffic count required (exit ramp or rest stop)?	No	Yes
If yes,		
Number of Cars: _____	Duration: _____

Appendix C. Essential Worker Statement 2020

6/5/2020

To: Law Enforcement, City Personnel, DOT Personnel, other local interested parties

Re: 2020 Iowa Observational Survey of Seat Belt Use – essential project workers

Iowa State University has been contracted by the Governor's Traffic Safety Bureau to perform the annual Observational Survey of Seat Belt Use for the state of Iowa. ISU has performed this task since 2012.

The team of observers are uniquely and extensively trained using GTSB guidelines as well as DOT safety measures. The project manager at ISU has alerted DOT, county level, and city managers about where and when our enumerators will be in their areas, and specifically which streets or roads they'll be observing. ISU's contact at the GTSB - Cinnamon Weigel - has shared our schedule of observations with pertinent law enforcement agencies.

Our team members will observe for one hour at each site. They wear Ansi II level vests and usually hats. They will carry a clipboard but may also have on their person bug spray, sunscreen, water, car keys. Some will drive ISU vehicles and some will drive their own, depending on where their home base is. They will park at businesses where available, parks, field drives, and overpasses, being sure to be well out of the right of way. Again, the team is trained extensively on this process. Some sites will require the use of road signs that say "Survey Crew", and they are placed according to DOT safety guidelines as pertaining to a construction site (these guidelines are the closest to what we are doing).

The Seat Belt Survey will be in the field from June 10, 2020 to June 18, 2020. These dates would be extended in cases where we we'd be unable to observe on scheduled days due to weather issues or road construction that we hadn't been able to account for ahead of time.

For any further questions or concerns please contact me using the information below. Thank you for keeping us safe and taking the time to follow up on your questions.
