INTRODUCTION

Applied Pavement Technology, Inc. (APTech), with assistance from Robinson Engineering Company, updated the Airport Pavement Management System (APMS) for the Iowa Department of Transportation, Modal Transportation Bureau – Aviation (Iowa DOT). The APMS provides a means to monitor the condition of the pavements within the state of Iowa and to proactively plan for their preservation.

As part of this project, pavement conditions at Harlan Municipal Airport were assessed in November 2021 using the Pavement Condition Index (PCI) procedure. During a PCI inspection, the types, severities, and amounts of distress present in a pavement are quantified. This information is then used to develop a composite index that represents the overall condition of the pavement in numerical terms, ranging from 0 (failed) to 100 (excellent). The PCI provides an overall measure of condition and an indication of the level of work that will be required to maintain or repair a pavement. The distress information also provides insight into what is causing the pavement to deteriorate, which is the first step in selecting the appropriate repair action to correct the problem.

Programmed into an APMS, PCI information is used to determine when preventive maintenance actions (such as crack or joint sealing) are advisable and to identify the most cost-effective time to perform major rehabilitation (such as an overlay or whitetopping). Delaying maintenance and rehabilitation (M&R) until a pavement structure has seriously degraded can cost many times more than if M&R was applied earlier in a pavement's life cycle, as shown in Figure 1. From a safety perspective, pavement distresses, such as cracks and loose debris, may pose risks in terms of the potential for aircraft tire damage and the ability of a pilot to safely control aircraft.

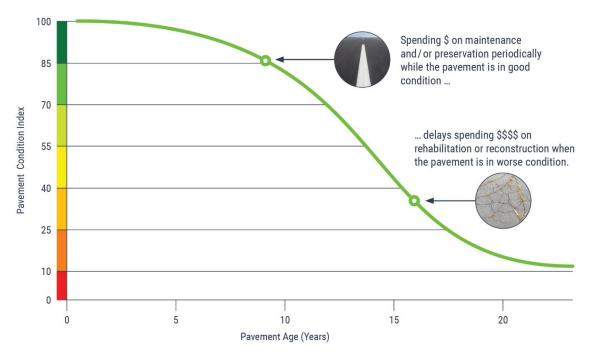

Figure 1. Pavement condition versus cost of repair.

The pavement evaluation results for Harlan Municipal Airport are presented within this report and can be used by Harlan Municipal Airport, the Iowa DOT, and the Federal Aviation Administration (FAA) to identify, prioritize, and schedule pavement M&R actions at the airport. In addition to this report, the interactive pavement management data visualization tool IDEA, containing the pavement management information collected during this project, was updated and may be accessed from the Iowa DOT's website (<u>https://iowadot.gov/aviation</u>).

PAVEMENT INVENTORY

The project began with a review of the existing inventory information pertaining to the pavements at Harlan Municipal Airport. The date of original construction, along with the date of any subsequent rehabilitation; the location of completed work; and the type of work undertaken were gathered. The information was used to update the pavement management database and associated maps as necessary to account for pavement-related work that had been undertaken since the last time the airport was evaluated in 2018.

The pavement network at Harlan Municipal Airport was then divided into branches, sections, and sample units. A branch is a single entity that serves a distinct function. For example, a runway is considered a branch because it serves a single function (allowing aircraft to take off and land). Taxiways, aprons, and T-hangars are also separate branches.

Each branch was further divided into sections. Traditionally, sections are defined as parts of the branch that share common attributes, such as cross-section, date of last construction, traffic level, and performance. Using this approach, if a runway was built in 1968 and then extended in 1984, it would contain two separate sections.

To estimate the overall condition of a pavement section, each section was subdivided into sample units. Portions of these sample units were evaluated during the pavement inspection, and the collected information was extrapolated to predict the overall section condition and quantities of distress.

Approximately 567,100 square feet of pavement were evaluated at Harlan Municipal Airport, as illustrated in Figure 2. This figure also shows the area-weighted age, in years, of the pavements at the time of the inspection. Figure 3 provides a map that details how the pavement network was divided into management units and identifies the sample units that were evaluated during the pavement inspection at Harlan Municipal Airport.

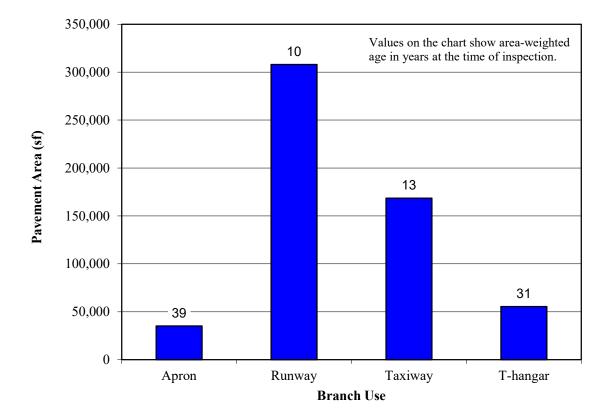

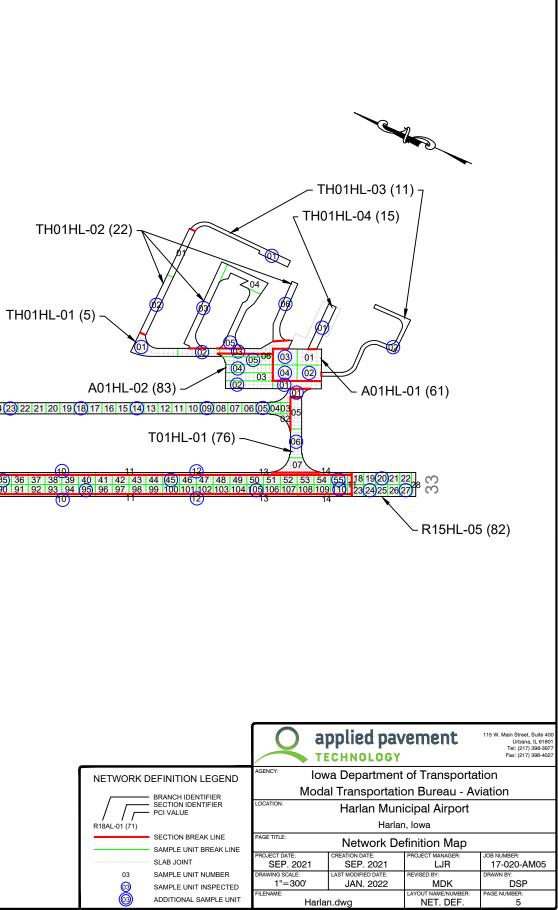

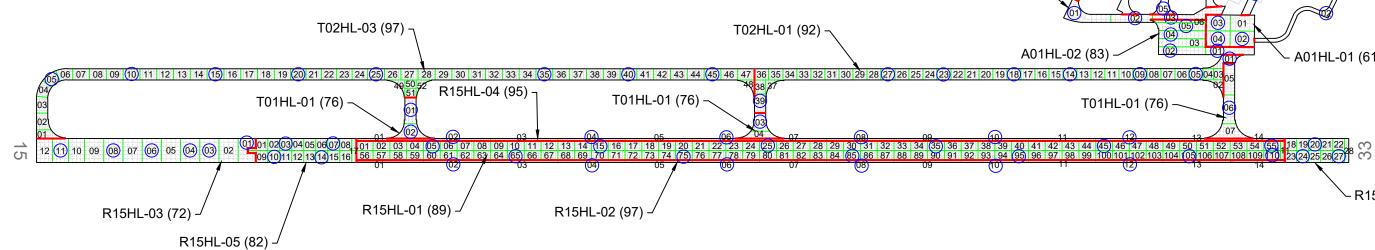

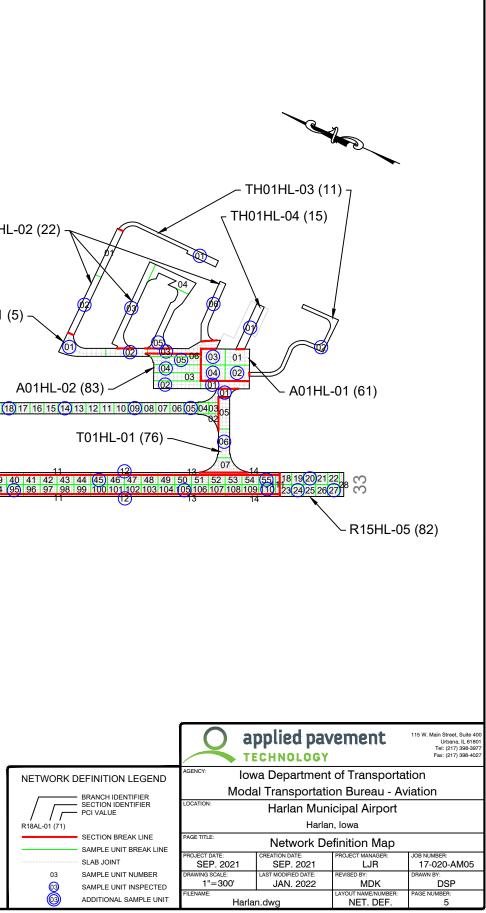

Figure 2. Pavement area by branch use at Harlan Municipal Airport.

FIGURE 3. NETWORK DEFINITION MAP.

PAVEMENT EVALUATION

Pavement Evaluation Procedure

APTech inspected the pavements at Harlan Municipal Airport using the PCI procedure described in:

- FAA Advisory Circular 150/5380-6C, *Guidelines and Procedures for Maintenance of Airport Pavements* (<u>https://www.faa.gov/documentLibrary/media/Advisory_Circular/150-5380-6C.pdf</u>).
- FAA Advisory Circular 150/5380-7B, *Airport Pavement Management Program (PMP)* (<u>https://www.faa.gov/documentLibrary/media/Advisory_Circular/150-5380-7B.pdf</u>).
- ASTM D5340-20, Standard Test Method for Airport Pavement Condition Index Surveys.

The PCI provides a numerical indication of overall pavement condition, as illustrated in Figure 4. The types and amounts of deterioration are used to calculate the PCI of the section. The PCI ranges from a value of 0, which represents a pavement in a failed condition, to a value of 100, which represents a pavement in excellent condition. It is important to note that factors other than overall PCI need to be considered when identifying the appropriate type of repair, including types of distress present and rate of deterioration. Also, since the PCI does not assess the structural integrity or capacity of the pavement structure, further testing may be needed to validate and refine the treatment strategy.

Figure 4. Visual representation of PCI scale on typical pavement surfaces¹.

¹Photographs shown are not specific to Harlan Municipal Airport.

Generally, pavements with relatively high PCIs that are not exhibiting significant load-related distress will benefit from preventive maintenance actions, such as crack sealing or joint resealing. As the PCI drops, the pavements may require major rehabilitation, such as an overlay or whitetopping. In some situations where the PCI has dropped low enough, reconstruction may be the only viable alternative due to the substantial damage to the pavement structure. Figure 5 illustrates how the appropriate repair type varies with the PCI of a pavement section and provides the corresponding colors used for the maps and charts in this report for each range of PCIs.

PCI Range	Repair	
86-100		
71-85	Preventive Maintenance	
56-70		
41-55	Major Rehabilitation	
26-40		
11-25	Reconstruction	
0-10		

Figure 5. PCI versus repair type.

The types of distress identified during the PCI inspection provide insight into the cause of pavement deterioration, which in turn helps in selecting a rehabilitation alternative that corrects the cause, thus eliminating or delaying its recurrence. PCI distress types are characterized as load-related (such as alligator cracking on asphalt-surfaced pavements or shattered slabs on portland cement concrete [PCC] pavements), climate/durability-related (such as weathering [a climate-related distress type on asphalt-surfaced pavements] and durability cracking [a durability-related distress type on PCC pavements]), and other (distress types that cannot be attributed solely to load or climate/durability).

Appendix A identifies the distress types considered during a PCI inspection and describes the likely cause of each distress type. It should be noted that a PCI is based on visual signs of pavement deterioration and does not provide a measure of structural capacity.

Pavement Evaluation Results

The pavements at Harlan Municipal Airport were inspected in November 2021. The 2021 areaweighted condition of Harlan Municipal Airport is 80, with conditions ranging from 5 to 97 (on a scale of 0 [failed] to 100 [excellent]). During the previous pavement inspection in 2018, the areaweighted PCI of the airport was 88.

Figure 6 summarizes the overall condition of the pavements at Harlan Municipal Airport, and Figure 7 presents area-weighted condition (average PCI adjusted to account for the relative size of the pavement sections) by branch use. Figure 8 is a map that displays the condition of the evaluated pavements. Table 1 summarizes the results of the pavement evaluation. Appendix B presents photographs taken during the PCI inspection, and Appendix C contains detailed information on the distress types observed during the visual survey. Appendix D includes detailed work history information that was collected during the record review process.

July 2022

Table 1. 2021 pavement evaluation results (continued).

Table Notes:

- 1. See Figure 3 for the location of the branch and section.
- 2. Surface Type: AC = asphalt cement concrete; AAC = asphalt overlay on AC; PCC = portland cement concrete; APC = asphalt overlay on PCC.
- 3. LCD = last construction date.
- 4. Distress due to load includes distress types that are attributed to a structural deficiency in the pavement, such as alligator cracking or rutting on asphaltsurfaced pavements or shattered slabs on PCC pavements.
- 5. Distress due to climate or durability includes distress types that are attributed to either the aging of the pavement and the effects of the environment (such as weathering, raveling, or block cracking on asphalt-surfaced pavements) or to a materials-related problem (such as durability cracking or alkali-silica reaction [ASR] on PCC pavements). If materials-related distresses were recorded during the inspection, further laboratory testing is required to definitively determine the type present.
- 6. Distress due to other refers to distress types that are not attributed to one factor but rather may be caused by a combination of factors.
- 7. Distress types are defined by ASTM D5340-20. L&T Cracking = Longitudinal and Transverse Cracking; LTD Cracking = Longitudinal, Transverse, and Diagonal Cracking; ASR = Alkali-Silica Reaction.

Inspection Comments

Harlan Municipal Airport was inspected on November 17, 2021. There were fourteen pavement sections defined during the inspection.

Runway

Runway 15/33 was defined by five sections. Section 01 contained low-severity alkali-silica reaction (ASR), corner spalling, joint spalling, faulting, and longitudinal, transverse and diagonal (LTD) cracking; all severities of joint seal damage; and shrinkage cracking. The suspected ASR was recorded in accordance with ASTM D5340-20. It should be noted that laboratory testing in the form of petrographic analysis is the only definitive way to validate the presence of ASR; however, the formation of a precipitate is evidence of a reaction consistent with this type of materials-related distress. Section 02 was in excellent condition with areas of low- and medium-severity joint seal damage and low-severity joint spalling recorded during the inspection. Low-severity corner break, all severities of faulting, medium- and high-severity joint seal damage, and low- and medium-severity joint seal damage and low-severity joint spalling were noted in Section 04. Section 05 contained low-severity corner spalling, low- and medium-severity faulting and LTD cracking, and medium-severity joint seal damage.

Taxiways

Taxiway 01 connected Runway 15/33 to the parallel taxiway and consisted of one section. All severities of faulting and LTD cracking, low- and medium-severity joint seal damage, and low-severity joint spalling were identified in Section 01.

Taxiway 02, the parallel taxiway to Runway 15/33, contained two sections. Section 01 contained low-severity corner break, faulting, and joint spalling as well as low- and medium-severity joint seal damage and LTD cracking. Section 03 was in excellent condition with areas of low-severity corner break and low- and medium-severity joint seal damage noted during the inspection.

Apron

The apron area was defined by two sections. Areas of low- and medium-severity corner break, corner spalling, and joint spalling; high-severity joint seal damage; medium-severity shattered slab and LTD cracking; shrinkage cracking; and low-severity large patching and small patching were recorded in Section 01. Section 02 contained low-severity corner break and faulting; medium-severity corner spalling; and low- and medium-severity joint seal damage, joint spalling, and LTD cracking.

T-Hangar

The T-hangar area consisted of four sections in poor condition. Section 01 had areas of mediumand high-severity corner break and shattered slab, high-severity joint seal damage and joint spalling, all severities of LTD cracking, low-severity large patching, and shrinkage cracking. Low- and medium-severity alligator cracking and depression, all severities of longitudinal and transverse (L&T) cracking, medium-severity raveling, and low-severity rutting were recorded in Section 02. Section 03 contained low- and medium-severity alligator cracking and rutting, all severities of L&T cracking, high-severity patching, and medium- and high-severity raveling. Section 04 had areas of medium-severity alligator cracking and L&T cracking, low-severity depression, low- and medium-severity patching, and medium- and high-severity raveling identified throughout at the time of inspection. The low-severity L&T cracking in Sections 02, 03, and 04 was unsealed, and the medium-severity L&T cracking was due to either the development of secondary cracking, unsatisfactory crack sealant, or unsealed crack widths greater than $\frac{1}{4}$ in.

PAVEMENT MAINTENANCE AND REHABILITATION PROGRAM

Using the information collected during the pavement inspection, the PAVER pavement management software was used to develop a 5-year M&R program for Harlan Municipal Airport. In addition, a 1-year plan for localized preventive maintenance (such as crack sealing and patching) was prepared.

Analysis Parameters

Critical PCIs

PAVER uses critical PCIs to determine whether localized preventive maintenance or major rehabilitation is the appropriate repair action. Above the critical PCI, localized preventive maintenance activities are recommended. Below the critical PCI, major rehabilitation actions, such as an overlay or reconstruction, are recommended. The Iowa DOT set the critical PCIs at 65 for runways, 60 for taxiways, and 55 for aprons and T-hangars.

Localized Preventive Maintenance Policies and Unit Costs

Localized preventive maintenance policies were developed for asphalt-surfaced and PCC pavements. These policies, shown in Appendix E, identify the localized preventive maintenance actions that the Iowa DOT considered appropriate to correct for the different distress types and severities. The Iowa DOT provided unit costs for each of the localized preventive maintenance actions included in these policies, and these costs are detailed in Appendix E. Please note that this information is of a general nature for the entire state. The localized preventive maintenance policies and unit costs may require adjustment to reflect specific conditions at Harlan Municipal Airport.

Major Rehabilitation Unit Costs

PAVER estimates the cost of major rehabilitation based on the predicted PCI of the pavement section. The Iowa DOT provided the costs for major rehabilitation, and they are presented in Appendix E. If major rehabilitation is recommended in the 5-year program, further engineering investigation will be needed to identify the most appropriate rehabilitation action and to estimate the cost of such work more accurately.

Budget and Inflation Rate

An unlimited budget with a start date of July 1, 2022 and an inflation rate of 4.0 percent was used during the analysis.

Analysis Approach

The 5-year M&R program was prepared with the goal of maintaining the pavements above established critical PCIs. During this analysis, major rehabilitation was recommended for pavements in the year they dropped below their critical PCI. For the first year (2022) of the analysis only, a localized preventive maintenance plan was developed for those pavement sections that were above their critical PCI. If major rehabilitation was triggered for a section in 2023 or 2024, then localized preventive maintenance was not recommended for 2022. While localized preventive maintenance should be an annual undertaking at Harlan Municipal Airport, it is not possible to accurately predict the propagation of cracking and other distress types. Therefore, the airport should budget for maintenance every year and can use the 2022 localized

preventive maintenance plan as a baseline for that work. As the pavements age, it can be assumed that the amount of localized preventive maintenance required will increase.

Analysis Results

A summary of the M&R program for Harlan Municipal Airport is presented in Table 2. Detailed information on the recommended localized preventive maintenance plan for 2022 is provided in Appendix F.

Year	Branch	Section	Surface Type	Type of Repair	Estimated Cost
2022	A01HL	01	PCC	Preventive Maintenance	\$17,288
2022	A01HL	02	PCC	Preventive Maintenance	\$7,477
2022	R15HL	01	PCC	Preventive Maintenance	\$120,256
2022	R15HL	02	PCC	Preventive Maintenance	\$1,456
2022	R15HL	03	PCC	Preventive Maintenance	\$50,801
2022	R15HL	04	PCC	Preventive Maintenance	\$4,368
2022	R15HL	05	PCC	Preventive Maintenance	\$29,801
2022	T01HL	01	PCC Preventive Maintenance		\$16,427
2022	T02HL	01	PCC Preventive Maintenance		\$4,769
2022	T02HL	03	PCC	Preventive Maintenance	\$6,932
2022	TH01HL	01	PCC Major Rehabilitation		\$222,370
2022	TH01HL	02	AC	Major Rehabilitation	\$288,698
2022	TH01HL	03	AC	Major Rehabilitation	\$116,288
2022	TH01HL	04	AC	Major Rehabilitation	\$39,190

Table 2. 5-year M&R program under an unlimited funding analysis scenario.

Total Estimated Cost: \$926,000

Table Notes:

- 1. See Figure 3 for the location of the branch and section.
- 2. Surface Type: AC = asphalt cement concrete; AAC = asphalt overlay on AC; PCC = portland cement concrete; APC = asphalt overlay on PCC.
- 3. Type of Repair: Major Rehabilitation such as pavement reconstruction or an overlay; Localized Preventive Maintenance such as crack sealing or patching.
- 4. The estimated costs provided are of a general nature for the entire state and may require adjustment to reflect specific conditions at Harlan Municipal Airport.

The recommendations made in this report are based on a broad network-level analysis and meant to provide Harlan Municipal Airport with an indication of the type of pavement-related work required during the next 5 years. Further engineering investigation may be necessary to identify which repair action is most appropriate. In addition, the cost estimates provided are based on overall unit costs for the entire state, and Harlan Municipal Airport should adjust the plan to reflect local costs.

Because an unlimited budget was used in the analysis, it is possible that the pavement repair program may need to be adjusted to consider economic or operational constraints. The identification of a project need does not necessarily mean that state or federal funding will be

available in the year it is indicated. It is important to remember that regardless of the recommendations presented within this report, Harlan Municipal Airport is responsible for repairing pavements where existing conditions pose a hazard to safe operations.

General Maintenance Recommendations

In addition to the specific maintenance actions presented in Appendix F, it is recommended that the following strategies be considered for prolonging pavement life:

- 1. Regularly inspect all safety areas of the airport and document all inspection activity. A sample form that can be used to perform these inspections is provided in Table 3 of this report.
- Provide a method of tracking all maintenance activities that occur as a result of inspections. These need to be reported to the FAA and the Iowa DOT. This information is used to update the APMS records and is required to remain in compliance with Public Law 103-305 (see the next section of this report for further information on this law).
- 3. Conduct an aggressive campaign against weed growth through timely herbicide applications and mowing programs of the safety areas. Vegetation growth in pavement cracks is destructive and significantly increases the rate of pavement deterioration.
- 4. Implement a periodic crack and joint sealing program. Keeping water and debris out of the pavement system by sealing cracks and joints is a proven and cost-effective method of extending the life of the pavement system.
- 5. Ensure that dirt does not build up along the edges of the pavements. This can create a "bathtub" effect, reducing the ability of water to drain away from the pavement system.
- 6. Closely monitor the movement of heavy equipment (particularly farming, construction, and fueling equipment) to make sure it is only operating on pavements that are designed to accommodate heavy loads. Failure to restrict heavy equipment to appropriate areas may result in the premature failure of airport pavements.

FAA Requirements (Public Law 103-305)

Because Harlan Municipal Airport is in the National Plan of Integrated Airport Systems (NPIAS), the airport sponsor is required to keep the airport in a viable operating condition. This includes maintaining airport pavements in accordance with Public Law 103-305. Public Law 103-305 states that after January 1, 1995, NPIAS airport sponsors must provide assurances or certifications that an airport has implemented an effective airport pavement maintenance management system (PMMS) before the airport will be considered for federal funding of pavement replacement or reconstruction projects. To be in full compliance with the federal law, the PMMS must include the following components at minimum: pavement inventory, pavement inspections, record keeping, information retrieval, and program funding.

This report serves as a complete pavement inventory and detailed inspection. To remain in compliance with the law, Harlan Municipal Airport will also need to undertake monthly drive-by inspections of pavement conditions and track pavement-related maintenance activities.

FAA Advisory Circular 150/5380-7B provides detailed guidance pertaining to the requirements for an acceptable pavement management program (PMP). Appendix A of the FAA Advisory Circular 150/5380-7B outlines what needs to be included in a PMP to remain in compliance with this law and Grant Assurance #11. The following is a copy of this Appendix, along with

instructions for supplementing this report so that all requirements are met. Note that the italicized words are direct quotations from the FAA Advisory Circular.

FAA Advisory Circular 150/5830-7B, Appendix A. Pavement Management Program (PMP)

A-1.0. An effective PMP specifies the procedures to follow to assure that proper preventative and remedial pavement maintenance is performed. The program should identify funding or anticipated funding and other resources available to provide remedial and preventive maintenance activities. An airport sponsor may use any format deemed appropriate, but the program needs to, as a minimum, include the following:

A-1.1. Pavement Inventory. The following must be depicted:

a. Identification of all runways, taxiways, and aprons with pavement broken down into sections each having similar properties.

The network definition map provided in Figure 3 of this report shows the location of all runways, taxiways, aprons, and T-hangars at Harlan Municipal Airport. If any new pavements are constructed or any pavement areas are permanently closed, this map must be updated. Project plans should be submitted to the Iowa DOT after project completion.

b. Dimensions of pavement sections.

The dimensions of all runways, taxiways, aprons, and T-hangars are stored in the PAVER database. Appendix C provides information on length, width, and area. In addition, the network definition map (Figure 3) is drawn to scale. Any changes to pavement dimensions must be recorded.

c. Type of pavement surface.

The type of pavement for each section at Harlan Municipal Airport is listed in Table 1 of this report and is also stored in the PAVER database. Any changes to pavement type (through an overlay or reconstruction) must be recorded.

d. Year of construction and/or most recent major rehabilitation.

Dates for pavement construction, rehabilitation, or reconstruction must be recorded. The current pavement history for Harlan Municipal Airport is provided in Appendix D of this report.

e. Whether AIP [Airport Improvement Program] or PFC [Passenger Facility Charge] funds were used to construct, reconstruct, or repair the pavement.

Funding sources for all pavement projects should be recorded.

A-1.2. PMP Pavement Inspection Schedule. Airports must perform a detailed inspection of airfield pavements at least once a year for the PMP. If a pavement condition index (PCI) survey is performed, as set forth in ASTM D5340, Standard Test Method for Airport Pavement Condition Index Surveys, the frequency of the detailed inspection by PCI surveys may be extended to three years. Less comprehensive routine daily, weekly, and monthly maintenance inspections required for operations should be addressed.

This report consists of a detailed inspection that will extend the inspection period to 3 years. It is the airport sponsor's responsibility to perform monthly drive-by inspections. A sample pavement inspection report form is provided in Table 3 of this report.

A-1.3. Record Keeping. The airport must record and keep on file complete information about all detailed inspections and maintenance performed until the pavement system is replaced. The types of distress, their locations, and remedial action, scheduled or performed, must be documented. The minimum information recorded includes:

- a. Inspection date
- b. Location
- c. Distress types
- d. Maintenance scheduled or performed

Items a through c are satisfied by this inspection report. Item d is the responsibility of the airport, as is record keeping of the monthly drive-by inspections.

A-1.4. Information Retrieval. An airport sponsor may use any form of record keeping it deems appropriate so long as the information and records from the pavement survey can generate required reports, as necessary.

Keep this report, monthly drive-by inspection reports, construction updates, and all records of maintenance activities in a readily accessible location so that they can be easily retrieved as requested by the FAA.

SUMMARY

This report documents the results of the pavement evaluation conducted at Harlan Municipal Airport. A visual inspection of the pavements in 2021 found that the overall condition of the pavement network is a PCI of 80. A 5-year pavement repair program, shown in Table 2, was generated for Harlan Municipal Airport, which revealed that approximately \$926,000 needs to be expended on M&R. Harlan Municipal Airport should utilize these study results to assist in planning for future maintenance needs as part of the airport CIP planning process.

APPENDIX A

CAUSE OF DISTRESS TABLES

Distress Type	Probable Cause of Distress
Alligator Cracking	Fatigue failure of the asphalt surface under repeated traffic loading.
Bleeding	Excessive amounts of asphalt cement or tars in the mix or low air void content, or both.
Block Cracking	Shrinkage of the asphalt and daily temperature cycling; it is not load associated.
Corrugation	Traffic action combined with an unstable pavement layer.
Depression	Settlement of the foundation soil or can be "built up" during construction.
Jet-Blast Erosion	Bituminous binder has been burned or carbonized.
Joint Reflection Cracking	Movement of the concrete slab beneath the asphalt surface due to thermal and moisture changes.
L&T Cracking	Cracks may be caused by (1) a poorly constructed paving lane joint, (2) shrinkage of the asphalt surface due to low temperatures or hardening of the asphalt, or (3) reflective cracking caused by cracks in an underlying PCC slab.
Oil Spillage	Deterioration or softening of the pavement surface caused by the spilling of oil, fuel, or other solvents.
Patching	N/A
Polished Aggregate	Repeated traffic applications.
Raveling	Asphalt binder may have hardened significantly, causing coarse aggregate pieces to dislodge.
Rutting	Usually caused by consolidation or lateral movement of the materials due to traffic loads.
Shoving	Where PCC pavements adjoin flexible pavements, PCC "growth" may shove the asphalt pavement.
Slippage Cracking	Low strength surface mix or poor bond between the surface and the next layer of the pavement structure.
Swelling	Usually caused by frost action or by swelling soil.
Weathering	Asphalt binder and/or fine aggregate may wear away as the pavement ages and hardens.

Table A-1. Cause of pavement distress, asphalt-surfaced pavements.

Distress Type	Probable Cause of Distress
ASR	Chemical reaction of alkalis in the portland cement with certain reactive silica minerals. ASR may be accelerated by the use of chemical pavement deicers.
Blowup	Incompressible materials in the joints.
Corner Break	Load repetition combined with loss of support and curling stresses.
Durability Cracking	Concrete's inability to withstand environmental factors such as freeze-thaw cycles.
Faulting	Upheaval or consolidation.
Joint Seal Damage	Stripping of joint sealant, extrusion of joint sealant, weed growth, hardening of the filler (oxidation), loss of bond to the slab edges, or absence of sealant in the joint.
LTD Cracking	Combination of load repetition, curling stresses, and shrinkage stresses.
Patching (Small and Large)	N/A
Popouts	Freeze-thaw action in combination with expansive aggregates.
Pumping	Poor drainage, poor joint sealant.
Scaling	Over finishing of concrete, deicing salts, improper construction, freeze-thaw cycles, and poor aggregate.
Shattered Slab	Load repetition.
Shrinkage Cracking	Setting and curing of the concrete.
Spalling (Joint and Corner)	Excessive stresses at the joint caused by infiltration of incompressible materials or traffic loads; weak concrete at the joint combined with traffic loads.

Table A-2. Cause of pavement distress, PCC pavements.

Table E-4. 2022 unit costs (per square foot) based on pavement type and PCI ranges.

Pavement Type	PCI Range 0–40	PCI Range 40–50	PCI Range 50–60	PCI Range 60–70	PCI Range 70–80	PCI Range 80–90	PCI Range 90–100
AC	\$10.41	\$4.93	\$4.93	\$4.93	\$0.00	\$0.00	\$0.00
PCC	\$17.38	\$8.22	\$8.22	\$8.22	\$0.00	\$0.00	\$0.00

APPENDIX F

YEAR 2022 LOCALIZED PREVENTIVE MAINTENANCE DETAILS

				Distress	Distress		Unit	2022 Estimated
Branch	Section	Distress Type	Severity	Quantity	Unit	Maintenance Action	Cost	Cost
A01HL	01	Corner Break	Low	4	Slabs	Crack Sealing - PCC	\$3.02	\$100
A01HL	01	Corner Break	Medium	3	Slabs	Patching - PCC Full Depth	\$16.76	\$1,461
A01HL	01	Corner Spalling	Medium	1	Slabs	Patching - PCC Partial Depth	\$37.54	\$136
A01HL	01	Joint Seal Damage	High	81	Slabs	Joint Seal (Localized)	\$3.02	\$5,955
A01HL	01	Joint Spalling	Medium	4	Slabs	Patching - PCC Partial Depth	\$37.54	\$982
A01HL	01	LTD Cracking	Medium	4	Slabs	Crack Sealing - PCC	\$3.02	\$168
A01HL	01	Shattered Slab	Medium	3	Slabs	Slab Replacement - PCC	\$16.76	\$8,485
A01HL	02	Corner Break	Low	1	Slabs	Crack Sealing - PCC	\$3.02	\$34
A01HL	02	Corner Spalling	Medium	1	Slabs	Patching - PCC Partial Depth	\$37.54	\$138
A01HL	02	Joint Seal Damage	Medium	95	Slabs	Joint Seal (Localized)	\$3.02	\$6,543
A01HL	02	Joint Spalling	Medium	3	Slabs	Patching - PCC Partial Depth	\$37.54	\$660
A01HL	02	LTD Cracking	Medium	3	Slabs	Crack Sealing - PCC	\$3.02	\$103
R15HL	01	Joint Seal Damage	Medium	1,804	Slabs	Joint Seal (Localized)	\$3.02	\$76,527
R15HL	01	Joint Seal Damage	High	1,031	Slabs	Joint Seal (Localized)	\$3.02	\$43,729
R15HL	02	Joint Seal Damage	Medium	65	Slabs	Joint Seal (Localized)	\$3.02	\$1,456
R15HL	03	Corner Break	Low	2	Slabs	Crack Sealing - PCC	\$3.02	\$47
R15HL	03	Faulting	Medium	19	Slabs	Grinding (Localized)	\$0.36	\$86
R15HL	03	Faulting	High	10	Slabs	Slab Replacement - PCC	\$16.76	\$30,007
R15HL	03	Joint Seal Damage	Medium	183	Slabs	Joint Seal (Localized)	\$3.02	\$13,669
R15HL	03	Joint Seal Damage	High	92	Slabs	Joint Seal (Localized)	\$3.02	\$6,834
R15HL	03	LTD Cracking	Medium	4	Slabs	Crack Sealing - PCC	\$3.02	\$159

Table F-1. Year 2022 localized preventive maintenance details.

Branch	Section	Distress Type	Severity	Distress Quantity	Distress Unit	Maintenance Action	Unit Cost	2022 Estimated Cost				
R15HL	04	Joint Seal Damage	Medium	194	Slabs	Joint Seal (Localized)	\$3.02	\$4,368				
R15HL	05	Faulting	Medium	12	Slabs	Grinding (Localized)	\$0.36	\$32				
R15HL	05	Joint Seal Damage	Medium	693	Slabs	Joint Seal (Localized)	\$3.02	\$29,590				
R15HL	05	LTD Cracking	Medium	8	Slabs	Crack Sealing - PCC	\$3.02	\$179				
T01HL	01	Faulting	Medium	3	Slabs	Grinding (Localized)	\$0.36	\$14				
T01HL	01	Faulting	High	5	Slabs	Slab Replacement - PCC	\$16.76	\$10,681				
T01HL	01	Joint Seal Damage	Medium	37	Slabs	Joint Seal (Localized)	\$3.02	\$2,117				
T01HL	01	LTD Cracking	Medium	2	Slabs	Crack Sealing - PCC	\$3.02	\$56				
T01HL	01	LTD Cracking	High	2	Slabs	Slab Replacement - PCC	\$16.76	\$3,560				
T02HL	01	Corner Break	Low	9	Slabs	Crack Sealing - PCC	\$3.02	\$230				
T02HL	01	Joint Seal Damage	Medium	93	Slabs	Joint Seal (Localized)	\$3.02	\$4,292				
T02HL	01	LTD Cracking	Medium	9	Slabs	Crack Sealing - PCC	\$3.02	\$246				
T02HL	03	Corner Break	Low	6	Slabs	Crack Sealing - PCC	\$3.02	\$153				
T02HL	03	Joint Seal Damage	Medium	148	Slabs	Joint Seal (Localized)	\$3.02	\$6,779				

Table F-1. Year 2022 localized preventive maintenance details (continued).

Table Notes:

- 1. See Figure 3 for the location of the branch and section.
- 2. Distress types are defined by ASTM D5340-20. L&T Cracking = Longitudinal and Transverse Cracking; LTD Cracking = Longitudinal, Transverse, and Diagonal Cracking; ASR = Alkali-Silica Reaction.
- 3. The costs provided are of a general nature for the entire state and may require adjustment to reflect specific conditions at Harlan Municipal Airport.
