

Typical Roadway Sections

Design Manual

Chapter 3

Cross Sections

Originally Issued: 03-13-12

Revised: 05-15-14

Initial Typical Roadway Section

Preferred design criteria from Section [1C-1](#) sets up the initial typical roadway section, but project constraints will usually dictate the project typical roadway section.

Project Typical Roadway Section

A PMT agrees upon the typical project roadway section, or a project concept statement defines the typical section. Project constraints dictate selecting values that are not preferred values from Section [1C-1](#). Refer to Section [1C-8](#) for documenting design decisions.

Determining a Typical Roadway Section

The functional classification of a roadway defines widths of various design elements which compose a typical roadway section. Considerations when establishing a typical roadway section are:

- Modes of transportation
 - Motorized users.
 - Non-motorized users.
- Number of lanes
 - Through lanes.
 - Turn lanes.
 - Bike lanes.
 - Parking lanes.
- Median type
 - Divided roadway.
 - Undivided roadway.
- Shoulder type
 - Rural section.
 - Urban (curbed) section.
- Staging and Construction
 - Pavement width to maintain traffic through traffic zone.
 - Paver widths.

Quick Tips:

- The PMT should agree upon the typical roadway sections, or the sections are defined in the project concept.
- Refer to Section [1C-8](#) for information on documenting design decisions.
- For design decisions exceeding the design criteria, see Section [1B-7](#).
- The project typical sections should minimize the number of changes to the width of a paving machine.

- Other considerations
 - Future through lanes.
 - Pavement type.
 - Crown line location between sections.

Selecting a Typical Section

Project typical sections should minimize the number of changes to the width of a paving machine. The Designer can use the following process when selecting a project typical section.

1. Establish the main typical section for a roadway.
2. Determine normal spacing between longitudinal joint lines.
3. Determine construction sequence for the roadway and paving machine width.
4. Evaluate whether the construction sequence allows a contractor to build the roadway in sections that match the normal spacing between joint lines.
5. Establish section(s) for areas outside of the typical section (e.g., a roadway section with a left turn lane).
6. Compare the joint spacing between the typical section and the other sections.
7. Evaluate whether the other sections and construction sequence, allow the contractor use the paving machine through the other section.
8. Evaluate whether the contractor can use the paving machine to pave through the area with box-outs and hand pores to keep the paving machine width.
9. Evaluate whether the benefits gained in forcing a contractor to change the width of a paving machine, outweighs the cost to a project (e.g., right of way impacts).
10. Finalize the construction sequence and typical sections for the roadway.

Examples

The following examples illustrate typical sections created from design values from the Design Criteria Worksheets in Section [1C-1](#). The examples are not intended for a designer to copy into their project; instead, the purpose is to aid designers with defining the table values from Section [1C-1](#) to create project typical sections.

Urban Roadways

Urban roadways are usually defined as roadways containing curb and gutter sections, not necessarily a roadway within an urban boundary.

2-Lane Curbed Roadways

Figure 1: 2-lane urban roadway with standard paver width of 31 feet.

Figure 2: 2-lane urban roadway with a parking lane and a standard paver width of 37 feet.

Figure 3: 2-lane urban roadway with a right turn lane.

Figure 4: 2-lane urban roadway with a standard paver width of 26 feet.

Figure 5: 2-lane roadway with a parking lane and a standard paver width of 34 feet.

Figure 6: 2-lane urban roadway with 11 foot lanes and right turn lane.

Note: Unless approved otherwise by the Jurisdiction, all 2-lane urban roadways should comply with standard paving machine widths of 26 and 31, or 34 and 37 feet for roadways with on street parking.

3-Lane Urban Roadways

Figure 7: 3-Lane urban roadway with a two way left turn lane.

4-Lane Urban Roadways

Figure 8: 4-lane urban roadway.

Figure 9a: 4-lane urban roadway with channelization.

Figure 9b: 4-lane urban roadway with a left turn lane and channelization.

Figure 10: 4-lane urban roadway with 11 foot lanes.

Figure 11: 4-lane urban roadway with a raised median.

5-Lane Urban Roadways

Figure 12: Curbed 4-lane urban roadway with a two way left turn lane.

Rural Roadways

Rural roadways are usually defined as roadways containing shoulders.

Two-Lane Rural Roadways

Figure 13: 2-lane rural roadway.

Figure 14: 2-lane rural roadway with a right turn lane.

Figure 15: 2-lane rural roadway with a left turn lane and widening one side.

Figure 16: 2-lane rural roadway with a left turn lane and widening one side.

Figure 17: 2-lane rural roadway with safety edge.

4-Lane Rural Roadways

Figure 18: 4-lane rural roadway.

Figure 19: 4-lane rural roadway with right turn lane.

Figure 20: 4-lane rural roadway with a left turn lane.

Figure 21: 4-lane rural roadway with partial depth paved shoulders.

Figure 22: 4-lane rural roadway with full depth paved shoulder on the outside.

Figure 23: 4-lane rural roadway with a curbed shoulder on the outside.

Chronology of Changes to Design Manual Section:

003A-001 Typical Roadway Sections

- | | | |
|-----------|-----|---|
| 5/15/2014 | NEW | Revised guidance for selecting a typical section. Revised figures to better reflect Design Criteria Worksheets in Section 1C-1. |
| 9/13/2012 | NEW | New. Describes typical sections used for roadway design. |
